## 2024_28_III_OOPS Using Java Lab

### 2028_REC_OOPS using Java_Week 8_Q1

Attempt : 1
Total Mark : 10
Marks Obtained : 10

### Section 1 : Coding

1. Problem Statement

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotExceptionAtTheRateExceptionDomainException

A typical email address should have a " . " character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

***Input Format***

The first line of input contains the email to be validated.

***Output Format***

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

***Sample Test Case***

Input: sample@gmail.com

Output: Valid email address

***Answer***

```
// You are using Java
import java.util.*;

class DotException extends Exception {
    public DotException(String message) {
        super(message);
    }
}

class AtTheRateException extends Exception {
    public AtTheRateException(String message) {
        super(message);
    }
}

class DomainException extends Exception {
    public DomainException(String message) {
        super(message);
    }
}

class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String email = sc.nextLine().trim();

        try {
            validateEmail(email);
            System.out.println("Valid email address");
        }
        catch (DotException e) {
            System.out.println("DotException: " + e.getMessage());
```

```
            System.out.println("Invalid email address");
        }
        catch (AtTheRateException e) {
            System.out.println("AtTheRateException: " + e.getMessage());
            System.out.println("Invalid email address");
        }
        catch (DomainException e) {
            System.out.println("DomainException: " + e.getMessage());
            System.out.println("Invalid email address");
        }
        catch (Exception e) {
            System.out.println("Invalid email address");
        }
    }

    public static void validateEmail(String email) throws DotException,
AtTheRateException, DomainException {

        int atCount = email.length() - email.replace("@", "").length();
        if (atCount != 1 || email.startsWith("@") || email.endsWith("@") ||
email.contains("@@")) {
            throw new AtTheRateException("Invalid @ usage");
        }

        if (email.startsWith(".") || email.endsWith(".") || email.contains("..")) {
            throw new DotException("Invalid Dot usage");
        }

        String[] parts = email.split("@");
        if (parts.length != 2) {
            throw new AtTheRateException("Invalid @ usage");
        }

        String domainPart = parts[1];
        if (!domainPart.contains(".")) {
            throw new DotException("Invalid Dot usage");
        }

        int dotCountAfterAt = domainPart.length() - domainPart.replace(".",
"").length();
```

```
        if (dotCountAfterAt != 1) {
            throw new DotException("Invalid Dot usage");
        }

        String[] domainParts = domainPart.split("\\.");
        if (domainParts.length != 2) {
            throw new DotException("Invalid Dot usage");
        }

        String domainExtension = domainParts[1];
        if (!(domainExtension.equals("in") || domainExtension.equals("com") ||
              domainExtension.equals("net") || domainExtension.equals("biz"))) {
            throw new DomainException("Invalid Domain");
        }
    }
}
```

***Status :*** Correct **Marks : 10/10**
