Section 1 : Coding

1. Problem Statement

Mr.Kapoor wants to create a program to calculate the volume of a Cuboid and a Cube using method overriding.

Implements a base class Cuboid with attributes for length, width, and height. Include a method calculateVolume() that computes the volume of the cuboid.

Extends the base class with a subclass Cube representing a cube, where all sides are equal. Override the calculateVolume() method in the Cube class to compute the volume of the cube.

The program should take user input for the dimensions of the cuboid and the side length of the cube and display the calculated volumes with two decimal places.

Input Format

The first line of input consists of 3 space-separated double values, representing the cuboid length, width, and height, respectively.

The second line consists of a double value, representing the side length of the cube.

Output Format

The first line of output prints the volume of the cuboid, rounded off to two decimal places.

The second line prints the volume of the cube, rounded off to two decimal places.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 60.0 60.0 60.0
50.0

Output: Volume of Cuboid: 216000.00
Volume of Cube: 125000.00

Answer

```
import java.util.Scanner;

class Cuboid {
    protected double length;
    protected double width;
    protected double height;

    public Cuboid(double length, double width, double height) {
        this.length = length;
        this.width = width;
        this.height = height;
    }

    public double calculateVolume() {
        return length * width * height;
    }
}
```

```

    }
    public void displayVolume() {
        double volume = calculateVolume();
        System.out.printf("Volume of Cuboid: %.2f\n", volume);
    }
}

```

```

class Cube extends Cuboid {
    private double side;

```

```

    public Cube(double side) {

```

```

        super(side, side, side);
        this.side = side;
    }

```

```

    @Override
    public double calculateVolume() {
        return side * side * side;
    }

```

```

    public void displayVolume() {
        double volume = calculateVolume();
        System.out.printf("Volume of Cube: %.2f\n", volume);
    }
}

```

```

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

```

```

        double cuboidLength = scanner.nextDouble();
        double cuboidWidth = scanner.nextDouble();
        double cuboidHeight = scanner.nextDouble();

```

```

        // Regular object instantiation for Cuboid
        Cuboid cuboid = new Cuboid(cuboidLength, cuboidWidth, cuboidHeight);
        System.out.printf("Volume of Cuboid: %.2f\n", cuboid.calculateVolume());

```

```

        double cubeSide = scanner.nextDouble();

```

```

        // Upcasting - Using superclass reference for subclass object (DMD)

```

```
Cuboid cube = new Cube(cubeSide); // Upcasting
System.out.printf("Volume of Cube: %.2f", cube.calculateVolume()); // Calls
Cube's method dynamically
```

```
    scanner.close();
}
}
```

Status : Correct
