Attempt : 1
Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

Sesha is developing a weather monitoring system for a region with multiple weather stations. Each weather station collects temperature data hourly and stores it in a 2D array.

Write a program that can add the temperature data from two different weather stations to create a combined temperature record for the region.

Input Format

The first line of input consists of two space-separated integers N and M, representing the number of rows and columns of the matrices, respectively.

The next N lines consist of M space-separated integers, representing the values of the first matrix.

The following N lines consist of M space-separated integers, representing the values of the second matrix.

Output Format

The output prints the addition of the two matrices in N rows and M columns, representing the combined temperature record.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 3 3
1 2 3
4 5 6
7 8 9
1 1 1
2 2 2
3 3 3

Output: 2 3 4
6 7 8
10 11 12

Answer

```java
// You are using Java
import java.util.*;

class main{
    public static void main(String args[]){
        Scanner sc = new Scanner(System.in);
        int n = sc.nextInt();
        int m = sc.nextInt();
        int[][] arr = new int[n][m];
        int[][] brr = new int[n][m];
        int[][] crr = new int[n][m];

        for(int i=0 ; i<n ; i++){
            for(int j=0 ; j<m ; j++){
                arr[i][j] = sc.nextInt();
            }
        }
```

```java
    for(int i=0 ; i<n ; i++){
        for(int j=0 ; j<m ; j++){
            brr[i][j] = sc.nextInt();
        }
    }

    for(int i=0 ; i<n ; i++){
        for(int j=0 ; j<m ; j++){
            crr[i][j] = arr[i][j] + brr[i][j];
        }
    }

    for(int i=0 ; i<n ; i++){
        for(int j=0 ; j<m ; j++){
            System.out.print(crr[i][j] + " ");
        }
        System.out.print("\n");
    }
    }
}
```

Status : Correct   **Marks : 10/10**
